A postdoctoral position is available to study the molecular mechanisms of pathogenesis and host defense during *Aspergillus fumigatus* infection. The project will focus on fungal and host factors that are responsive to *in vivo* oxygen levels which subsequently modulate virulence and host inflammatory responses in clinically relevant models of aspergillosis. Two years of initial funding are guaranteed for generating data and applying for independent funding. Applicants should have a PhD in microbiology, immunology or closely related field. Experience in molecular mycology and/or immunology are preferred, but those interested in mycology from other backgrounds are welcome to apply.

The Cramer Laboratory is located at the Geisel School of Medicine at Dartmouth in Hanover, New Hampshire in the Department of Microbiology and Immunology. The position affords the opportunity to utilize state-of-the-art facilities and resources associated with a major research and teaching institution, while enjoying the quality of life characteristic of the upper valley in New England.

**To apply,** Send a (1) CV (2) cover letter including statement of career goals and interests, and (3) list of three references **by email** to:

Robert A. Cramer, PhD.,
